2SD300C17A1 Preliminary Datasheet

Dual-Channel High-quality and Low-cost SCALE™-2 Driver Core

Abstract

The SCALE™-2 dual-driver core 2SD300C17A1 is a second source to Infineon's 2ED300C17-S and 2ED300C17-ST. The driver is fully pin and function-compatible to the 2ED300C17-S/2ED300C17-ST and was designed for applications in which high reliability is expected.

The use of Power Integrations' highly integrated SCALE-2 chipset allows 63% of the components to be dispensed with compared to the 2ED300C17-S/2ED300C17-ST. This advantage is impressively reflected in increased reliability (function and MTBF) with simultaneously lower costs.

The 2SD300C17A1 combines a complete two-channel driver core with all components required for driving, such as an isolated DC/DC converter, short-circuit protection, failure soft shut down, short pulse suppression as well as supply voltage monitoring. Each of the two output channels is electrically isolated from the primary side and the other secondary channel.

The driver provides a gate voltage swing of ±15V. An output current of 30A and 4W drive power is available per channel.

Its outstanding EMC with a dv/dt strength of more than 50V/ns allows safe and reliable operation in even the demanding industrial applications.

Product Highlights

✓ Dual channel driver
✓ Highly integrated SCALE-2 chipset
✓ Switching frequency up to 60kHz
✓ Gate current ±30A
✓ 4W output power per channel
✓ Direct and half-bridge mode
✓ IGBT short-circuit protection
✓ Failure soft shut down
✓ Isolated DC/DC converter
✓ Safe isolation to EN 50178
✓ UL compliant
✓ Reliable, long service life

Applications

✓ 1:1 replacement of 2ED300C17-S
✓ 1:1 replacement of 2ED300C17-ST
✓ IGBTs up to 1700V
Safety Notice!

The data contained in this data sheet is intended exclusively for technically trained staff. Handling all high-voltage equipment involves risk to life. Strict compliance with the respective safety regulations is mandatory!

Any handling of electronic devices is subject to the general specifications for protecting electrostatic-sensitive devices according to international standard IEC 60747-1, Chapter IX or European standard EN 100015 (i.e. the workplace, tools, etc. must comply with these standards). Otherwise, this product may be damaged.

Important Product Documentation

This data sheet contains only product-specific data. For a detailed description, must-read application notes and important information that apply to this product, please refer to "2SD300C17 Description & Application Manual" on www.power.com/igbt-driver/go/2SD300C17.

### Footnotes to the Key Data

1) The maximum peak gate current refers to the highest current level occurring during the product lifetime. It is an absolute value and does also apply for short pulses.

2) The average supply input current is limited for thermal reasons. Higher values than specified by the absolute maximum rating are permissible (e.g. during power supply start up) if the average remains below the given value, provided the average is taken over a time period which is shorter than the thermal time constants of the driver in the application.

3) There is no means of actively controlling or limiting the input current in the driver. In the case of start-up with very high blocking capacitor values, or in case of short circuit at the output, the supply input current has to be limited externally.

4) The maximum output power must not be exceeded at any time during operation. The absolute maximum rating must also be observed for time periods shorter than the thermal time constants of the driver in the application.

5) An extended output power range is specified for maximum ambient temperatures of 70°C.
Preliminary Data Sheet

6) Undervoltage monitoring of the primary-side supply voltage (V_{DD} to GND). If the voltage drops below this limit, a fault is transmitted to both outputs SOA and SOB and the IGBTs are switched off.

7) Undervoltage monitoring of the secondary-side supply voltage (Vx+ to COM x and COM x to Vx- which correspond with the approximate turn-on and turn-off gate-emitter voltages). If the corresponding voltage drops below this limit, the IGBT is switched off and a fault is transmitted to the corresponding SOx output on the primary side.

8) The delay time is measured between 50% of the input signal and 10% (turn-on) or 90% (turn-off) of the corresponding output.

9) Transmission delay of fault state from the secondary side to the primary status output.

10) The blocking time sets a minimum time span between the end of any fault state and the start of normal operation (remove fault from pin SOx). The value of the blocking time is programmed on the driver and cannot be modified externally.

11) HiPot testing (= dielectric testing) must generally be restricted to suitable components. This gate driver is suited for HiPot testing. Nevertheless, it is strongly recommended to limit the testing time to 1s slots as stipulated by EN 50178. Excessive HiPot testing at voltages much higher than 1200V_{AC(eff)} may lead to insulation degradation. No degradation has been observed over 1min. testing at 5000V_{AC(eff)}. Every production sample shipped to customers has undergone 100% testing at the given value for 1s.

12) Partial discharge measurement is performed in accordance with IEC 60270 and isolation coordination specified in EN 50178. The partial discharge extinction voltage between primary and either secondary side is coordinated for safe isolation to EN 50178.

13) The dead time is measured between 50% voltage swing of the gate-emitter voltage which is turned off and 50% voltage swing of the gate-emitter voltage which is turned-on.
